MEDLINE-99227646; PubMed-9568991;

X and Y., L1 Y., Munshi S., Sardana W., Cole J.L., Sardana M.,
Steinkuehler C., Tomel L., de Francesco R., Kuo L.C., Chen Z.;
"Complex of NS3 protease and NS4A peptide of BK strain hepatitis C
" virus: a 2.2-A resolution structure in a hexagonal crystal form.";
Protein Sci. 7:837-647(1998).

-1 FUNCTION: THE SMALL PROTEINS NS2A, NS2B, NS4A AND NS4B ARE
HYDROPHOBIC, SUGGESTING A POSSIBLE MEMBRANE-RELACATION.
NS3 AND NS5 MAY PLAY A ROLE IN THE VIRAL FNA REPLICATION.

-1 CATALYTIC ACTIVITY: Hydrolysis of four peptide bonds in the viral
precursor polyprotein, commonly with Asp or Glu in the P6
position, Cys or Thr in P1 and Ser or Ala in P1'.

-1 CATALYTIC ACTIVITY: N nucleoside triphosphate = N diphosphate +
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               the viral
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  [RNA](N).
-I- SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A LIPOPROTEIN ENVELOPE CONSISTS OF TWO PROTEINS:
PROTEIN M AND GLYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN C AND MINA.
                                                                         MEDLINE-97015088; PubMed-8861916;

01-AUG-1992 (Rel. 23, Last sequence update)
01-AUG-1992 (Rel. 21, Last sequence update)
01-AUG-1992 (Rel. 41, Last annoctation update)
Genome polyprotein (Contains: Capsid protein C (Core protein) (P22);
Envelope glycoprotein E1 (GP32) (GP35); Envelope glycoprotein E2
(GP68) (GP70) (NS1); Protein P7; Nonstructural protein NS2 (P21)
(EC 3.4.22.-); Protease/helicase NS3.(P70) (Hepacivirin)
(EC 3.4.21.98); Nonstructural protein NS5A (P56); Nonstructural protein
NS5B (P66) (P70) (RNA-directed RNA polymerase) (EC 2.7.7.48)].
Hepatitis C virus (isolate Japanese) (HCV).
Viruses; SSRNA positive-strand viruses, no DNA stage; Flaviviridae;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    -1- FUNCTION: THE SMALL PROTEINS NS2A, NS2B, NS4A AND NS4B ARE HYDROPHOBIC, SUGGESTING A POSSIBLE MEMBRANE-RELATED FUNCTION.
NS3 AND NS5 MAY PLAY A ROLE IN THE VIRAL RNA REPLICATION.
-1- CATALYTIC ACTIVITY: Hydrolysis of four peptide bonds in the viral precursor polyprotein, commonly with Asp or Glu in the P6 position, Cys or Thr in P1 and Ser or Ala in P1'.
-1- CATALYTIC ACTIVITY: N nucleoside triphosphate = N diphosphate +
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS: PROPEIN M AND GLYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN C AND MRNA.
                                                                                                                                                                                                                                                                                                          Gaps

Mucheotide sequence of the genomic RNA of hepatitis C virus isolated
from a human carrier: comparison with reported isolates for conserved
T and divergent regions. "I sequence of the genomic RNA AND NSA AND NSA AND NSA PROFILE J. Gen. Virol. 72:8697-2704(1991).
I. Gen. Virol. 72:8697-2704(1991).
I. FUNCTION: THE SMALL PROFILE MEMBRANE-RELATED FUNCTION.
NS3 AND NS5 MAY PLAY A ROLE IN THE VIRAL RNA REPLICATION.
NS3 AND NS5 MAY PLAY A ROLE IN THE VIRAL RNA REPLICATION.
OF CHARITIC ACTIVITY: Hydrolysis of four peptide bonds in the viral precusor polyprotein, commonly with Asp or Glu in the P6
posttion, Cys or Thr in Pl and Ser or Ala in Pl'.
C -1 CATALTIC ACTIVITY: N nucleoside triphosphate = N diphosphate +

Genome polyprotein (Contains: Capsid protein C (Core protein) (P22);
Envelope glycoprotein El (GP32) (GP35); Envelope glycoprotein E2 (GP68) (GP70) (NS1); Protein P7: Nonstructural protein NS2 (P21) (EC 3.4.22.-); Protease/helicase NS3 (P70) (Hepacivirin) (EC 3.4.21.98); Nonstructural protein NS48 (P4); Nonstructural protein NS58 (P56); Nonstructural protein NS58 (P66) (P70) (RNA-directed RNA polymerase) (EC 2.7.7.48)].
NS58 (P66) (P70) (RNA-directed RNA polymerase) (EC 2.7.7.48)].
Nituses: SSRNA positive-strand viruses, no DNA stage; Flaviviridae;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     (RNA)(N).

SUBURIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A LIPOPROTEIN ENVELOPE CONSISTS OF TWO PROTEINS:
PROTEIN M AND GLYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN C AND MRNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    InterPro; IPR007095; RNA_pol_DS_PS.

The Taiwanese hepatitis C virus genome: sequence determination and mapping the 5' termini of viral genomic and antigenomic RNA.";
Virology 188:102-113(1992).
I- FUNCTION: THE SMALL PROTEINS NS2A, NS2B, NS4A AND NS4B ARE
HUDROPHOBIC, SUGGESTING A POSSIBLE MEMBRANE-RELATED FUNCTION.
NS3 AND NS5 MAY PLAY A ROLE IN THE VIRAL RNA REPLICATION.
I- CATALITIC ACTIVITY: Hydrolysis of four peptide bonds in the viral
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              (RNA)(N).
SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLECCAPSID COVERED BY A LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS:
          RNA-DIRECTED RNA POLYMERASE (POTENTIAL)
                                       SIMILARITY).

                                                                                               SUBCELLULAR LOCATION: SEEMS TO BE LOCALIZED INTRACELLULARLY TO THE TRANS GOLGI NETWORK. PROPEPTIDE CLEAVAGE IS A PREREQUISITE FOR EXIT OF FURIN MOLECULES OUT OF THE ENDOPHASMIC RETICULUM (ER). SECOND CLEAVAGE IN THE PROPEPTIDE OCCUR IN THE TRANS GOLGI NETWORK (TGN), WHICH IS FOLLOWED BY THE RELEASE OF THE PROPEPTIDE BOUND TO FURIN AND THE ACTIVATION OF FURIN. TISSUE SPECIFICITY: SEEMS TO BE EXPRESSED UBIQUITOUSLY. DOMAIN: CONTAINS A CYTOPLASMIC DOMAIN RESPONSIBLE FOR ITS TGN LOCALIZATION AND RECYCLIKE FROM THE CELL SUFFACE. PTM: THE PROPEPTIDE IS AUTOCATALYTICALLY REMOVED THROUGH AN
respective precursors.
COFACTOR: CALCIUM-DEPENDENT.
ENZYME REGULATION: COULD BE INHIBITED BY THE NOT SECONDLY CLEAVED

I. Sübunt: The Virion of This Virus is a nucleocapsid covered by a Lipoproprein by the Envelope Consists of Two Proteins:
Protein M and Glycoprofin E. The Nucleocapsid is a Complex of Protein C and Mrna (BY SIMILARITY).
                                                                                                            Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence 190,

Sequence 192, Application US/08635886C

Sequence 192, Application US/08635886C

Patent No. 655114

GENERAL INFORMATION:

APPLICANT: LEBEOUX-NOELS, Geert

APPLICANT: DELEYS, Robert

TITLE OF INVENTION: IMMUNDOMINANT HUMAN T CELL EPITOPES OF HEPATITIS C

TITLE OF INVENTION: VIRUS

TITLE OF INVENTION: VIRUS

TITLE OF INVENTION: VIRUS

CURRENT APPLICATION NUMBER: US/08/635,886C

CURRENT APPLICATION NUMBER: D196-04-25

PRIOR FILING DATE: 1994-10-28

PRIOR FILING DATE: 1994-10-28

PRIOR FILING DATE: 1993-11-04

NUMBER OF SEQ ID NOS: 286

SEQ ID NO 192

LENGTH: 450

TYPE: PRIOR FILING PARENTIN OF SEQ ID NO 152

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Description

Genomic characterization and mutation rate of hepatitis C virus
'Genomic characterization and mutation rate of hepatitis C virus
1solated from a patient who contracted hepatitis during an epidemic
of non-A, non-B hepatitis in Japan.";
J. Gen. Virol. 73:2725-2729(1952).
I- SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A
LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS:
PROTEIN M AND GIXCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF
PROTEIN C AND MRNA.
                                                                                                                                                                                                           01-JUL-1993 (Rel. 26, Last Sequence update)
16-OCT-2001 (Rel. 40, Last annotation update)
Genome polyprotein [Contains: Capsid protein C (Core protein) (P22);
Envelope glycoprotein EI (GP32) (GP35); Envelope glycoprotein E2
(GP68) (GP70) (NS1)] (Frament).
Hepatitis C virus (Isolate HCV-476) (HCV).

-I- SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEDCAPSID COVERED BY LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS: E1 AND E2. THE NUCLEGCAPSID IS A COMPLEX OF PROTEIN C AND MANA.

-I- PTW: THE STRUCTURAL PROTEINS C, E1 AND E2 ARE PRODUCED BY PROTEOLYTIC PROCESSING BY THE HOST SIGNAL PEPTIDASES.

-I- SIMILARITY: THE NS3 PROTEASE BELONGS TO PEPTIDASE FAMILY U39.
